Lab 2 — Jira Evidence

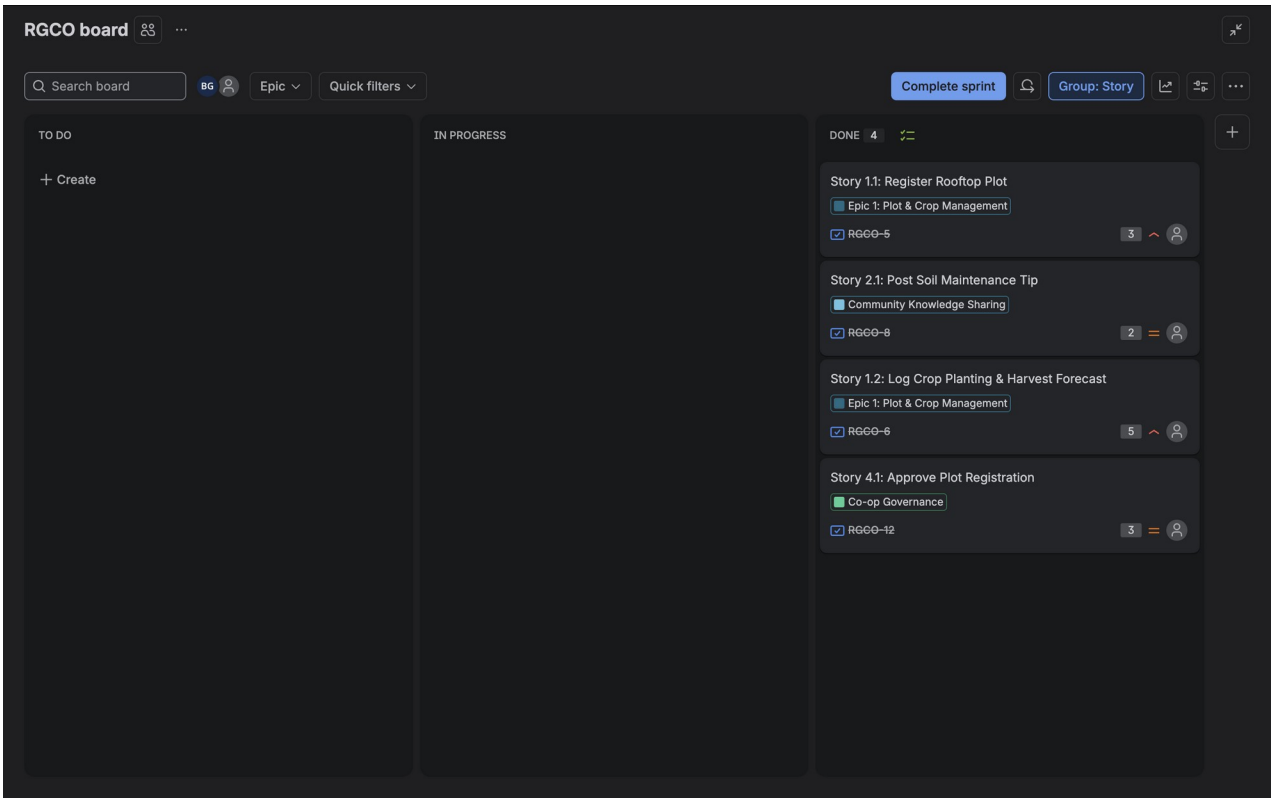

Backlog — Epics, User Stories & Story Points

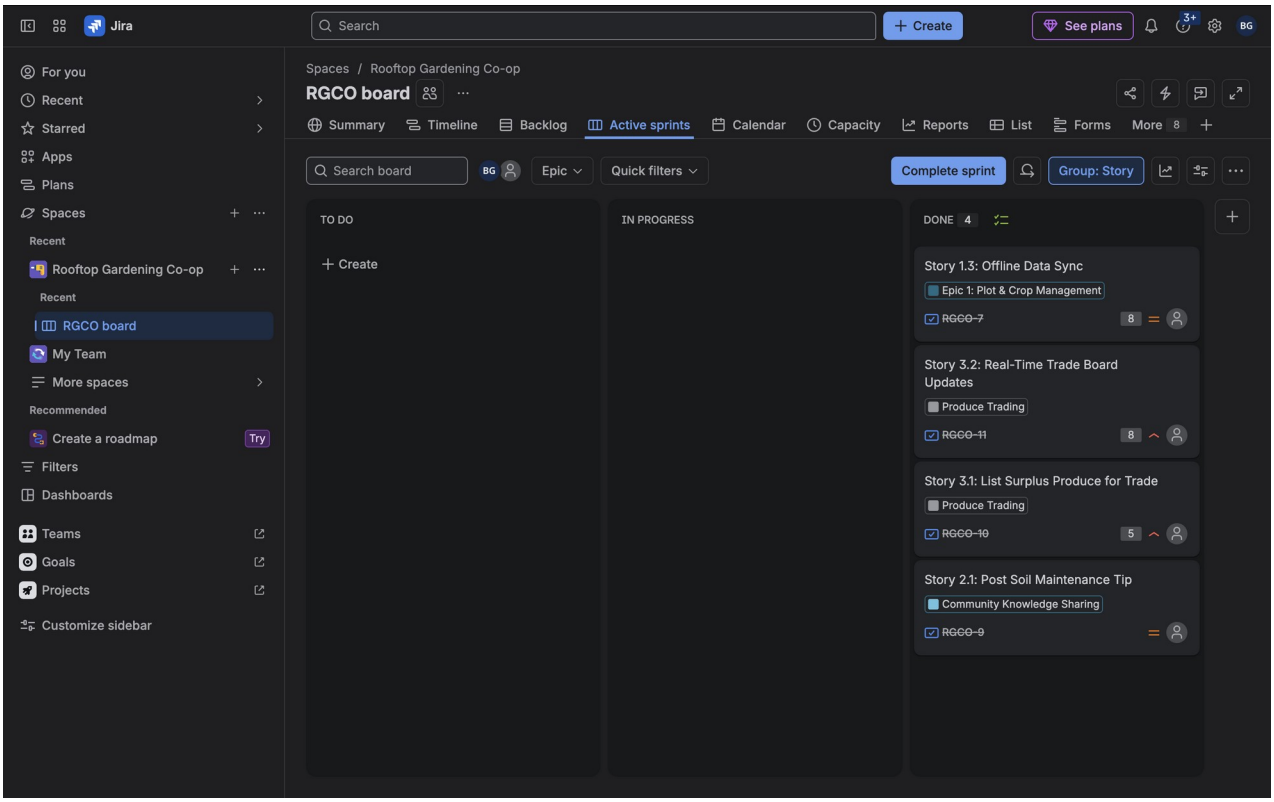

Active Sprint Board — Sprint 1 in progress

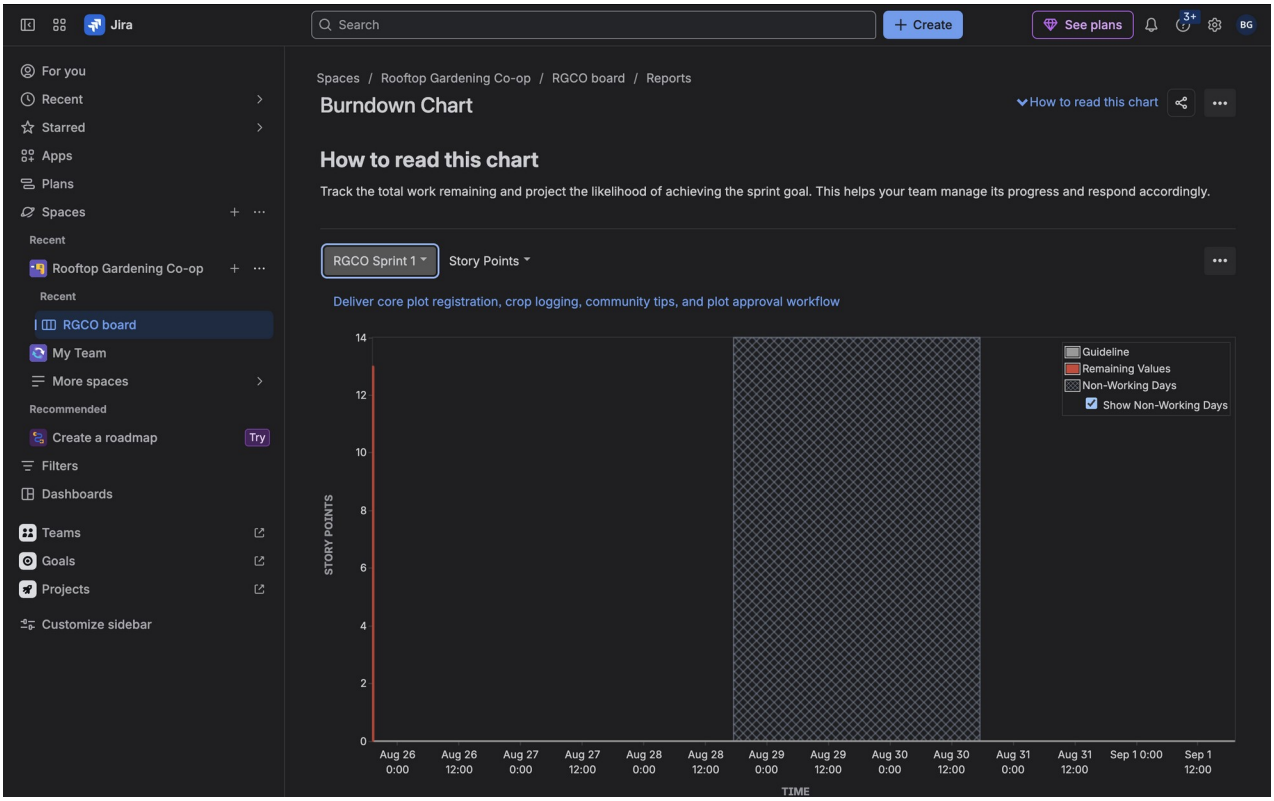

Active Sprint Board — Sprint 1 completed

Active Sprint Board — Sprint 2 completed

Burndown Chart — Sprint 1

Reflection

1. Did your estimations reflect the actual effort?

Since this was a simulated sprint rather than real development work, I wasn't able to test whether the story points matched actual build time. That said, the relative sizing held up logically. Stories I rated higher effort, like Offline Data Sync and Real-Time Trade Board Updates at 8 points, involve genuinely harder problems (sync logic, concurrency, security) than something like Post Soil Maintenance Tip at 2 points, which is really just a basic post-and-display feature. The Fibonacci scale made it easy to keep that gap proportional instead of guessing in raw hours.

2. Was your backlog well-prioritized?

Mostly yes. The four High-priority stories, Register Rooftop Plot, Log Crop Planting, List Surplus Produce for Trade, and Real-Time Trade Board Updates, are all stories nothing else in the app can function without, so it made sense to front-load those. Offline Data Sync ended up Medium priority even though it's the most complex story, because it's a resilience feature rather than a blocker for day-one use. In hindsight, Approve Plot Registration probably deserved a closer look at High rather than Medium, since without Community Leader approval, no plot ever technically goes live.

3. How did your simulated sprint align with your plan?

Both sprints finished with 100% of planned stories moved to Done, no scope creep and nothing got dropped or reprioritized mid-sprint. The catch is that because I was simulating the sprint rather than running it over a real week, I moved all the cards from To Do to Done within minutes of starting each sprint. That's why the burndown chart shows a flat line rather than a gradual diagonal decline, there wasn't a real time gap for work to burn down across. In an actual week-long sprint with a team, I'd expect a more gradual, staggered completion pattern instead.

4. What insights did the burndown chart give about your team's capacity?

Because the sprint was compressed into a single sitting, the chart doesn't reflect real capacity signals like early finishes or missed forecasts. What it does show clearly is that all committed story points, 13 in Sprint 1 and 21 in Sprint 2, were fully burned down to zero, meaning the sprint's scope was fully delivered as planned. If this were a real multi-day sprint, a similarly clean drop to zero, without a sharp last-day cliff, would be a good sign that stories were estimated and broken down at a reasonable size rather than being too large or too vague to track incrementally.
